SOME DATA ON HYDROGRAPHY OF THE ADRIATIC (1946—1951)

by

Miljenko Buljan and Marija Marinković*)

Institute of Oceanography and Fisheries, Split

INTRODUCTION

The material published in this volume is composed of various data obtained in the course of studies, carried out at the Institute of Oceanography and Fisheries at Split, during the period extending between 1946 and 1951. The material, obtained during the »Hvar Expedition« (Fishery Biological Cruises M/V »Hvar« 1948-1949), and making up a logical whole, has not been included here, as it constitutes a separate publication (Station List, Fisher.-Biol. Cruises M/V »Hvar«).

The data relative to 1949 and 1951 cruises in the regions around the mouths of the rivers Krka and Zrmanja have also been separated, since they also make up a distinct whole, dealing with brackish water, and will be separately treated (Buljan M: Hydrographic conditions in the estuarial regions of the rivers Krka and Zrmanja, — in preparation).

The material gathered at 122 various places in the Adriatic is given in this volume. Some of the stations were handled several times, and some of them only once. The number of outings (to the stations) was 505, during which more than 2300 levels were elaborated.

Most of the outings took place on M/V »Predvodnik«, and some of them on M/V »Hvar«. There are two Kelvin hand-operated sounding-apparatus with about 500m of steel wire aboard of each vessel. The winch was used only when samples were taken from depths exceeding 200m, in the deep South Adriatic.

Water samples were taken by means of reversing water sample bottles of the Ekman type and D. A. E. Meteor type.

Where 0m depth is given for the surface level, it means a depth of about 50cm.

Temperatures were generally measured by means of protected reversing thermometers made by Messrs Richter & Wiese, and in a smaller number of cases by means of Messrs. Negretti & Zambra ones.

The salinity was obtained by applying the Mohr method, this implying the employment of normal Kopenhagen water (Mayer, H. 1932), so the data have a standard accuracy.

*) The present address of the second author is: Institut za biologiju mora, Rovinj.

The oxygen content was determined according to Winkler method (Jacobson, J. 1921), but using sodium bi-chromate as standard solution.

The reckoning of the saturation of oxygen was made by mean of a slide-rule.

Phosphates were determined by means of Denière's method (H. Wattenberg, 1937), and silicates by means of Diénert and Vandenbulcke method (H. Wattenberg, op. cit.), using a Pulfrich photometer with the corresponding filters.

To determine the alkalinity, the titration with Ca/OH/2 according to H. Wattenberg and A. Wittig method (1940) was applied.

The concentration of hydrogen-ions (pH) was determined on board by means of an electric pH-meter with a glass electrode made by Messrs. Radiometar, Copenhagen. No correction of the data was made. The data obtained by means of indicator method before 1950, are not given here owing to their unreliability.

Dr. T. Gamulin, Dr. V. Cvijić, and former members of the Institute staff Dr. V. Radojević and Z. Pintar took also part, beside the Authors, in the gathering of water samples and temperature measuring. Since the first and the last of the mentioned colleagues were engaged in the gathering of hydrographic material for the purposes of their investigations into the field of planktonology, only three levels are mostly given for such station (to which do not belong either Station 1 or the day-and-night stations).

Nearly all the chemical analyses were made at the hydrochemical laboratory of the Institute of Oceanography and Fisheries at Split, and only a smaller part of them on board of the vessels during the cruising itself.

As the work progressed, the material was grouped into sections I to V according to geographic regions, as shown in Chart 1. Each station was numbered (1-122). Stations belonging to an individual section are shown in the chart covering the section concerned. (See pictures 2 to 6).

The numbers in italics refer to oxygen, alkalinity and pH. When available below station are given: direction and strength of wind in international units; movement of the sea in international units; state of weather*); barometric pressure in mm; air temperature in C°.

*) According to the Yugoslav Ship Diary (edit. 1954) the code for description of the state of weather is following:

00	clear sky	vedro bez oblaka
01	cloudines $\frac{1}{2}$ of the sky	oblačno do $\frac{1}{2}$ neba
02	cloudiness $\frac{3}{4}$ of the sky	oblačno do $\frac{3}{4}$ neba
03	sky completely covered with clouds	nebo potpuno pokriveno oblacima
04	fog	magla-sumaglica
05	drizzle	sitna kiša
06	rain	kiša
07	snow	snijeg
08	showers	plijuskovi
09	gales & hurricanes	oluje
10	thunder or lightning	grmljavina i sijevanje

HIDROGRAFSKI PODACI ZA JADRANSKO MORE
SABRANI U RAZDOBLJU OD 1946—1951 GOD.

Miljenko Buljan i Marija Marinković*)

Institut za oceanografiju i ribarstvo, Split

U V O D

Materijal koji se publicira u ovom svesku sastoji se od niza podataka, koji su bili sakupljeni u toku različitih proučavanja, koje je sprovodio Institut za oceanografiju i ribarstvo u Splitu u razdoblju između 1946. i 1951. god.

Građa je sabrana na 122 različita mjesta u Jadranu. Neke od postaja su bile obrađivane više puta, a neke samo jedamput. Broj izlazaka na postaje je 505, a izvršeno je više od 2.300 obrada pojedinih nivoa.

Najveći broj izlazaka izvršen je M/B »PREDVODNIK«-om, a manji dio M/B »HVAROM«.

Uzorci morske vode bili su uzimani crpcima modela Ekman i modela ekspedicije Meteor.

Gdje je u podacima dana dubina od 0 m za površinski sloj, to ustvari predstavlja dubinu od oko 50 cm.

Temperature su bile općenito mjerene zaštićenim obrtljivim termometrima proizvodnje Richter & Wiese, Berlin, a manji broj mjerena je bio izveden termometrima proizvodnje Negretti & Zambra, London.

Podaci za klorinitet, odnosno salinitet, su dobiveni upotrebom Mohrove metode, titracijom morske vode otopinom srebnog nitrata. Točan titar otopine

*) Sadašnja adresa drugog autora je: Institut za biologiju mora, Rovinj.

srebrne soli je vršen uz upotrebu normalne kopenhaške vode (Mayer, H. 1932), pa podaci imaju potrebnu standardnu točnost.

Sadržaj kisika je bio određivan Winklerovom metodom (Jacobsen, J. 1921.), i to uz upotrebu natrijevog bikromata kao standardne otopine. Izračunavanje zasićenja kisika je bilo izvršeno uz pomoć mehaničkog računala.

Fosfati su bili određivani pomoću metode Denière (H. Wattenberg, 1937.) a silikati pomoću metode Diénert i Vandebulcke (H. Wattenberg, op. cit), i uz upotrebu fotometra Pulfrich sa odgovarajućim filtrima.

Određivanje alkaliniteta morske vode je vršeno metodom titracije otopinom kalcijevog hidroksida slijedeći pritom metodu H. Wattenberg i A. Wittig (1940).

Koncentracija vodikovih jona (pH) morske vode je bila određivana na brodu pomoću električnog pH-metra sa staklenom elektrodom izrade Radiometar, Kopenhagen. Nikakve korekture podataka nisu vršene. Podaci dobiveni metodom indikatora, s kojom se je radilo do 1950. god., nisu izneseni zbog manje pouzdanosti istih.

Skoro sve kemijske analize su izvršene u hidrokemijskom laboratoriju u Institutu za oceanografiju i ribarstvo u Splitu, a samo manji dio analiza je bio izведен za vrijeme samih krstarenja.

Brojke koje su tiskane kursivom odnose se na podatke za kisik, alkalitet i pH.

Na kraju podataka za pojedine postaje dodani su, gdje je to bilo moguće, slijedeći meteorološki podaci: pravac i snaga vjetra u internacionalnim jedinicama, kretanje mora u internacionalnim jedinicama, stanje vremena (ljestvica za ovaj podatak nalazi se u donjoj noti na strani 4.), barometarski tlak u mm, temperatura zraka u C°.
